

## My land cover and soils parameterization stalled!!

Posted by isburns - 2007/11/03 22:53

---

If, during soils parameterization, the progress dialog remains open but there is no activity in the ArcView status bar (bottom of the application), the parameterization has failed. Double-check the tables to ensure there are no empty records, no duplicates, and that all of the columns have been written correctly. If it's a SSURGO dataset, use the provided SSURGO tool to import, merge and clean the datasets.

In some cases, processing could stall due to overly large working directories. ArcView recommends working directory size limits of 100 MB; however, that limit is not absolute. Delete temporary files from the working directory by going to AGWA Tools>Preferences. In the File Management panel, click Delete to remove any temporary files. Or, use the Manage Data Sources in the ArcView File menu to delete unnecessary files (especially files beginning with "intsec" or "ints").
